DECAY CHARACTERISTICS OF ONCE-THROUGH LWR AND LMFBR SPENT FUELS, HIGH-LEVEL WASTES, AND FUEL-ASSEMBLY STRUCTURAL MATERIAL WASTES

A. G. Croff and C. W. Alexander

ABSTRACT

The decay characteristics of spent fuel, high-level waste, and fuel-assembly structural material (cladding) waste are presented in the form of ORIGEN2 output tables for (1) a pressurized water reactor operating on a once-through cycle with low-enrichment uranium feed, (2) a boiling-water reactor operating on a once-through cycle with low-enrichment uranium feed, and (3) a liquid-metal fast breeder reactor being fueled with depleted uranium enriched with discharged light water reactor plutonium on a once-through basis. The decay characteristics given include the mass (g), radioactivity (Ci), thermal power (W), photon activity (photons/s and MeV/W-s in 18 energy groups), and neutron activity (neutrons/s) from (α,n) and spontaneous fission events. The first three characteristics are given for each element and for the principal nuclide contributors to the activation products, actinides, and fission products. Also included are a summary description of the ORIGEN2 reactor models that form the basis for the calculated results and a physical description of the fuel assemblies for the three reactors.

1. INTRODUCTION

The purpose of this document is to provide characterization of the principal nuclear fuel cycle materials typical of existing and projected nuclear reactors. The reactors considered in this report are (1) a pressurized water reactor (PWR) operating on a once-through cycle with low-enrichment uranium feed, (2) a boiling-water reactor operating on a once-through cycle with low-enrichment uranium feed, and (3) an advanced-oxide liquid-metal fast breeder reactor (LMFBR) with a burnup equal to 100,000 MWd/MTIHM.* The LMFBR uses typical light water reactor (LWR) plutonium as the fissile material and depleted uranium as the fertile material on a once-through (i.e., no plutonium recycle) basis. The three nuclear fuel cycle materials that are characterized in this report are (1) the spent fuel, (2) the high-level waste (HLW) from reprocessing,

*MTIHM — metric tons of initial heavy metal.

and (3) the fuel-assembly structural material (cladding) waste from reprocessing. The characterizations consist of a summary of the mass, radioactivity, thermal power, photon activity, and neutron activity of the most important nuclides in each of these materials. The characterizations contained herein are, in general, based on 1 MTIHM; that is, this report does not contain projections of the amounts of these materials expected to exist in the future.

The report first gives a summary description of the reactor models upon which the spent nuclear fuel composition depends. Also included here are descriptions of the fresh fuel and the physical characteristics of the fuel assemblies. Next, a description of the reprocessing plant parameters relevant to the generation of the HLW and cladding waste from the respective fuels is given. Following this are (1) a summary depiction of the characteristics of the spent fuel, HLW, and cladding waste as a function of decay time in the form of graphs and (2) a summary discussion referring to the tabular data in the appendixes that gives more detailed nuclear material characteristics.

All nuclear material characteristics contained in this report were generated using an updated version of the ORIGEN computer code, called ORIGEN2.[1-3]

2. DESCRIPTION OF REACTOR MODELS AND FUEL ASSEMBLIES

2.1 Description of LWR Models

A summary description of the characteristics of the PWR and BWR reactor models[4] is given in Table 1. The PWR is refueled with 33.78 tonnes of uranium that contains 3.2 wt % ^{235}U. This fuel is irradiated for 880 full-power days during an approximate 3-y time span at a specific power of 37.5 MW/MTIHM, resulting in a fuel burnup of 33,000 MWd/MTIHM. The uranium in the discharged fuel contains ∿0.83 wt % ^{235}U, and the fuel contains ∿0.95 wt % total plutonium.

The BWR is refueled with 36.68 tonnes of uranium that contains 2.75 wt % ^{235}U. The fuel is irradiated for 1062 full-power days during

an approximate 4-y time span at a specific power of 25.9 MW/MTIHM, resulting in a fuel burnup of 27,500 MWd/MTIHM. The uranium in the discharged fuel contains ∿0.78 wt % ^{235}U, and the fuel contains ∿0.87 wt % total plutonium.

2.2 Description of the LMFBR Models

A summary description of the LMFBR model[5] used in this report is given in Table 2. The LMFBR is refueled with 9.79 MTIHM of core fuel, 6.05 MTIHM of axial blanket fuel, and 7.98 MTIHM of radial blanket fuel. Both blankets are comprised entirely of depleted uranium (0.2 wt % ^{235}U) in the form of oxide pellets. The core fuel is comprised of the same depleted uranium enriched with 18.5% total plutonium (12.6 wt % fissile plutonium). The core fuel is irradiated for 822 full-power days during an approximate 3-y time span at a specific power of 123 MW/MTIHM, resulting in a final core fuel burnup of 101,300 MWd/MTIHM. The axial blanket fuel, which is contained in the same assembly as the core, has achieved a burnup of 5660 MWd/MTIHM at discharge. The radial blanket fuel is irradiated for 6 y and is moved from the outermost to the innermost row of the radial blanket during this time, resulting in a burnup of 7220 MWd/MTIHM at discharge.

The discharged core fuel consists of 8.78 tonnes of heavy metal (i.e., ∿10% of the core fuel has been fissioned) that contains 19.2 wt % total plutonium. The axial blanket contains ∿3.2 wt % total plutonium, and the radial blanket ∿3.7 wt % total plutonium.

2.3 Description of Fuel Assemblies

2.3.1 LWR fuel assemblies

A physical description of the BWR and PWR fuel assemblies is given in Table 3. The basic component of the fuel assembly is a fuel element (rod), which is a Zircaloy sheath containing uranium oxide fuel pellets. The diameter of the elements is slightly larger than that of an ordinary pencil. The elements are held in a square array with grid spacers, which are placed at intervals over the length of the elements. The total height

of the column of oxide fuel pellets in each element is ∿3.7 m (12 ft). When the gas plenum and end hardware are added, the result is an assembly with a total length of 4.0 to 4.5 m (13 to 15 ft).

A photograph of a PWR fuel assembly is shown in Fig. 1 to give some indication of its size. The assembly is comprised of a 17 x 17 array of fuel elements in which 25 locations are vacant to accommodate control rods and instrumentation. The assembly is ∿21-cm (8.5-in.) square and weighs ∿660 kg (1450 lb). About 80% of the weight is comprised of the uranium dioxide fuel pellets, and the rest is structural metal, which is mostly Zircaloy cladding.

The BWR assembly is comprised of an 8 x 8 array of fuel elements, which are somewhat larger than those in the PWR assembly. Only one location in the assembly is vacant, and the cruciform (cross-shaped) control rods are inserted between assemblies. The assembly is ∿14 cm (5.5 in.) square and weighs ∿275 kg (600 lb). About 75% of this assembly is comprised of the uranium dioxide fuel pellets. The structural material is mostly Zircaloy, which is used for the cladding and the fuel channel. The fuel channel is a square Zircaloy structure surrounding the assembly over its entire length. The fuel channels are often removed from spent fuel assemblies and used again on a new assembly.

2.3.2 LMFBR fuel assemblies

Although only one type of LMFBR is considered in this report, two types of assemblies are present in the reactor — the core/axial blanket assembly and the radial blanket assembly — both of which are described in Table 4. The axial blanket is comprised of depleted uranium fuel pellets, which are placed in a fuel element above and below the core fuel. The core fuel is plutonium-enriched depleted uranium. Since the core and axial blanket fuel are in the same element, they must clearly be contained in the same type of assembly. The radial blanket assemblies are arranged in a ring around the core/axial blanket assemblies in a bull's-eye pattern. The assemblies are hexagonal and ∿5.72 m (18.75 ft) tall, although the fuel height is only ∿1.9 m (6 ft). The remainder of the fuel assembly height is comprised of (1) a 1.9-m (6-ft) fission gas plenum, (2) mixing/shield

regions to homogenize the sodium temperature and shield the reactor structure from neutrons, and (3) a nose piece and handling socket to facilitate assembly insertion/removal. The distance between two of the flat sides of the hexagonal assembly is ∿13.8 cm (5.4 in.).

The core/axial blanket assembly contains 271 elements, each with a diameter about the size of a pencil. The oxide pellets are contained in stainless steel 316 cladding and have a small amount of sodium sealed inside the element to facilitate heat transfer through the gap between the pellet and the cladding. The elements have a stainless steel wire wrapped around them in a spiral fashion to separate them from each other and provide the space for the coolant to flow. Cross sections of simulated LMFBR fuel assemblies are shown in Fig. 2. The LMFBR assembly is encased in a stainless steel fuel channel similar to that in a BWR assembly. The total assembly weight is ∿260 kg (570 lb), of which ∿50% is the fuel material and 50% the stainless steel fuel-assembly structure.

The radial blanket assembly, which has the same overall size as the core/axial blanket assembly, contains 91 elements. The radial blanket elements, which are also wire-wrapped, stainless-steel-clad, and sodium-bonded, are almost twice the diameter of the core/axial blanket elements. The radial blanket assembly also has a stainless steel fuel channel. The assembly weighs ∿300 kg (660 lb), of which ∿66% is fuel material. The low power-generation rate allows the larger fuel element diameters, which results in a greater amount of uranium in the assembly and, consequently, a somewhat higher plutonium breeding rate.

3. DESCRIPTION OF SPENT FUEL AND WASTE PRODUCTS

3.1 Spent Fuel

The physical description of the spent fuel assemblies for each of the reactors is the same as that given in Sect. 2 for the fresh fuel. With one exception, all of the material that is present in the fresh fuel or generated during irradiation is contained in the spent fuel assembly. The exception is that only 10% of the tritium produced within the LMFBR fuel is assumed to be in the spent fuel. The remainder diffuses through the

stainless steel cladding and finds its way into reactor plant wastes. This is not the case in LWRs because the Zircaloy cladding is an effective barrier to this type of diffusion.

3.2 High-Level Waste

The as-generated HLW is an aqueous nitric acid stream that is comprised of the raffinate from the first solvent extraction cycle (or equivalent) plus dissolver solids and the concentrates of other wastes. This waste is assumed to be generated 160 d after the fuel is discharged from the LWRs and 90 d after discharge from the LMFBR, which is defined as time = 0 for the waste characteristics summarized in Sect. 4 and the appendixes. This waste is assumed to contain all of the fuel material except 100% of the hydrogen and noble gases; 99.9% of the fluorine, chlorine, bromine, and iodine; and 99.5% of the uranium and plutonium. For the LMFBR only, the HLW is assumed to contain 0.69% of the activated stainless steel in the fuel assembly. After some decay period, this waste would be converted to a solid form by some process such as calcination and vitrification, which would produce $\sim$0.06 to 0.085 m^3 (2 to 3 ft^3) of solidified HLW per MTIHM.

3.3 Fuel-Assembly Structural Material (Cladding) Waste

The so-called cladding waste is comprised of the fuel element cladding from which the fuel has been dissolved, the grid spacers or wire wrap, the end pieces, and the fuel channel and is more properly called fuel-assembly structural material (FASM) waste. This waste is highly radioactive as a result of the activation products and residual fuel material in the waste, although it does not generate substantial amounts of heat as the HLW does. The structural material waste is generated from the metal pieces removed and sheared from the fuel assembly before dissolution (e.g., the channels and end pieces) plus the small cladding segments that are removed from the dissolver after the fuel has been solubilized as much as is possible. A photograph of the appearance of the fuel cladding waste is given in Fig. 3.

ORNL-PHOTO 55390

Fig. 3. Photograph of typical cladding waste segments.

The FASM is assumed to be generated at the same time as the HLW, namely, 160 d after fuel discharge. The primary component of the waste is 100% of the activated structural metals in the LWRs and 99.31% of the activated stainless steel in the LMFBR. In addition, the FASM is assumed to contain 0.05% of the nonvolatile fission products and actinides in the fuel. This residual is equivalent to 0.05% of the HLW if the uranium and plutonium were to be left in the HLW. This fuel material is assumed to be insoluble either because of its refractory nature or because it is trapped in crevices in the cladding and is inaccessible to the nitric acid in the dissolver solution. The FASM from LWRs is also assumed to contain 30% of the tritium produced in the fuel in the form of a zirconium hydride layer on the cladding.

4. RESULTS AND DISCUSSION

The results of the ORIGEN2 calculation of the radionuclide characteristics of spent fuel, HLW, and fuel-assembly structural (cladding) material waste from PWRs, BWRs, and LMFBRs are given in Appendixes A to C. Since these appendixes are quite voluminous, Table 5 has been included to indicate the locations of the various types of data. Each page number in this table marks the beginning of a set of tables containing (1) the grams, curies, and watts of elements and the principal nuclides; (2) the photon activity in 18 energy groups; and (3) the (α,n) and spontaneous fission neutron activity for the actinides. All of these results are given as a function of decay time and are normalized to 1 tonne of heavy metal (uranium + plutonium) charged to the reactor. The spent fuel tables for the LMFBR are given for four combinations of the core, axial blanket, and radial blanket fuel.

A summary of some of the major results of the ORIGEN2 calculations is given in the form of graphs in Figs. 4 to 9. Figures 4 and 5 show the radioactivity and thermal power, respectively, of the various spent reactor fuels as a function of decay time. Figures 6 and 7 depict the radioactivity and thermal power, respectively, of the HLW produced by the reprocessing

of the fuels from the various reactors. The radioactivity and thermal power of the so-called cladding waste from the three reactors are shown in Figs. 8 and 9, respectively.

The characteristics of the PWR and BWR spent fuel and HLW are quite similar, with the PWR materials having somewhat higher levels of radioactivity and decay heat. The LMFBR characteristics are significantly different from either of these and are markedly higher, especially at longer times. Trends in the characteristics of the fuel-assembly structural material (cladding) waste are less evident since the curves are intertwined.
